Executive Summary
2013 Wisconsin Health Trends: Progress Report

Background

The Wisconsin State Health Plan for 2020 established a goal for everyone to live longer and better. Progress toward this goal can be measured by monitoring health outcomes, and the factors that contribute to those outcomes, for the state's population overall, as well as by considering the health status of specific populations within the state. Funded by a grant from the Wisconsin Partnership Program, this report assesses progress for 19 health indicators in Wisconsin by assessing trends over the past 10 years, and by determining whether current rates are better or worse than expected.

Two other related reports are useful in understanding the health of Wisconsin. The Opportunities to Make Wisconsin the Healthiest State report compares Wisconsin's health to the nation’s and other states’ health and the Health of Wisconsin Report Card examines disparities in health outcomes across specific subpopulations within Wisconsin. For information regarding policies and programs that have been used to address key health indicators, including whether these policies and programs have been shown to increase or decrease disparities in health outcomes, see the online or print version of What Works? Policies and Programs to Improve Wisconsin’s Health.

Approach

Ten-year trends for 19 leading health indicators were measured to see if the indicator improved or worsened over a 10-year period. The most current rates for each indicator were compared to the expected rate had the 10-year baseline trend continued.

In addition, where data were available, we report online both 10 year trends and current performance on these leading health indicators by gender, race and ethnicity, geography, and level of educational attainment.

Results

In the 2013 report, considering the population of the state in total, mortality trends for all age groups in Wisconsin improved. The greatest improvement was among children and young adults (ages 1-24). Other health outcomes are a cause for concern. The rate of low birthweight infants continues to increase. Additionally, an increasing percentage of adults report their health as fair or poor.

Improvements have been made in the health behavior areas of smoking, teen births and excessive drinking evidenced by their decreasing trends. However, the obesity trend continues to increase.

Although the most recent values for some socioeconomic and environmental indicators have improved, the trends are still worsening for all socioeconomic factors (high school drop-outs, unemployment, children in poverty and violent crime rate).

Summary

Wisconsin is making progress toward the 2020 goal of living longer. However, these data suggest that not everyone in the state is living better. If left unaddressed, many of the trends Wisconsin is experiencing—including increasing rates of adult obesity, low birthweight babies, and people who report their overall health to be fair or poor, along with worsening social and economic factors—will lead to poorer health outcomes and more disparities in the future. Current trends in health outcomes and health factors are markedly different for different subgroups within the state’s population. Efforts to improve health in Wisconsin must consider the full array of factors that influence how long and how well we live, and must begin with analysis of the circumstances that may produce longer healthier lives for some, but not all, of the state’s residents.
Overview of the Wisconsin Health Trends: Progress Report

The 2013 Wisconsin Health Trends: Progress Report provides a way to assess whether Wisconsin is achieving its goal for everyone to live longer and better (Wisconsin State Health Plan: Healthiest Wisconsin 2020).

How we measure health

The 19 health indicators are based on a model of population health that emphasizes that many factors, if improved, can make communities healthier places to live, learn, work and play. Measures of health outcomes and factors were chosen based on the County Health Rankings model (another research project of the University of Wisconsin Population Health Institute) which indicates that health behaviors, clinical care, socioeconomic factors and the physical environment all impact the length and quality of life. The measures included in this report are dynamic (meaning that the values have the potential to change annually) and are areas where targeted interventions can result in health improvement.

How progress is assessed

We calculated the annual percent change (APC) for each of the 19 health indicators during the past 10 years. An increasing annual percent change indicates a worsening health trend, while a decreasing annual percent change indicates an improving health trend.

- A ↓ or ↓ indicates Wisconsin improved on the health indicator during the past 10 years;
- A ↑ indicates Wisconsin’s performance on the health indicator has been stable; and
- A ↑ or ↑ indicates Wisconsin’s performance worsened during the past 10 years.

Using these baseline trends, we determine what the “expected” current rate would be for each indicator if the past 10 year trend continued. We compare this expected rate to the current “observed” rate, to see if it is better or worse. Current progress is determined by calculating the percent difference between the observed and expected rates.

- A green circle (●) indicates that Wisconsin did better than expected for the health indicator;
- A yellow circle (●) indicates that Wisconsin did about the same as expected; and
- A red circle (●) indicates that Wisconsin did worse than expected for the health indicator.

The Wisconsin Health Trends: Progress Report is useful for public health professionals, policy makers, and concerned citizens who are interested in assessing long-term and recent trends in leading health indicators. Readers of the Progress Report may wish to use its findings to begin or expand efforts to improve Wisconsin’s performance on one or more of these leading health indicators. To identify evidence-based strategies that promote health improvement, visit whatworksforhealth.wisc.edu. To find resources to develop an action plan that works for your community, please visit countyhealthrankings.org.

New analysis: Trends by population subgroups

In addition to the Wisconsin Health Trends: Progress Report, information on health trends among specific subgroups is now accessible online at uwphi.pophealth.wisc.edu/programs/match/healthiest-state/progress-report/2013/disparity.htm. Where available, baseline trend and current year data are graphed for the 19 leading health indicators included in this report—the data are broken down by gender, race/ethnicity, geography, and education. These graphs reveal how disparities in health factors and health outcomes within the state have improved or worsened in the last ten years. An example of the disparity graphs can be found on page 6.
### Health Outcomes

**Current Rate (versus expected)**

<table>
<thead>
<tr>

### Baseline Trend Progress

- \( \text{APC}^* > +1.0\%/\text{year} \)
- \( +1.0\%/\text{year} \geq \text{APC} > +0.5\%/\text{year} \)
- \( +0.5\%/\text{year} \geq \text{APC} \geq -0.5\%/\text{year} \)
- \( +0.5\%/\text{year} > \text{APC} \geq -0.5\%/\text{year} \)
- \( -0.5\%/\text{year} > \text{APC} \geq -1.0\%/\text{year} \)
- \( -1.0\%/\text{year} > \text{APC} \)

*\( \text{APC}^* = \text{Annual Percent Change} \)

### Current Progress

- \( \text{Current Rate is worse than expected rate (p<0.10)} \)
- \( \text{Current rate is no different than expected rate} \)
- \( \text{Current rate is better than expected rate (p<0.10)} \)
How to Interpret the Report

The *Wisconsin Health Trends: Progress Report* is useful for examining how the rates of specific health indicators have changed over the past year, compared to long term trends. Here is a guide to understanding the numbers and graphs provided in this report.

1. The known data points for the 10 years prior to the current year are graphed and a best fit linear regression is added to the graph. A decreasing line (↓) indicates improvement: this example shows a reduction in infant deaths.

2. The line is extended in order to show the expected value if Wisconsin continued with the same trend as in the previous 10 years ( 6.3).

3. The current observed value (5.7) is shown along with its 90% statistical confidence interval. Comparing this point to the expected trend line provides a comparison of how well Wisconsin is doing currently compared to what was expected.

4. The percent difference is calculated as:

   \[
   \text{Percent Difference} = \frac{\text{observed value} - \text{expected value}}{\text{expected value}} \times 100
   \]

For the infant death rate example above, the baseline trend shows that infant mortality rates decreased 0.8% per year (i.e., an improving trend). This is good news for Wisconsin. The trend is improving and the current rate (2010, the most recent year of data available), is 9.4% less than expected (5.7 vs. 6.3). This indicates that Wisconsin performed better than expected, suggesting continued improvement in infant deaths moving forward.
## 2013 Health Progress Assessment

</table>

**Current Observed Rate** = Rate or percentage provided for the most current year from the data sources

**Expected** = Value expected for the current year using a 10-year linear regression model for the previous ten years

**Percent Difference** = (Observed Value – Expected Value) / Expected Value \(\times 100\)

**Current Progress** = Based on the direction and significance of the percent difference value (see page 3 for cut off values)

**Baseline Trend** = \(-|e^{b1}|\times 100\) where \(e=\)exponential function and \(b=\)slope of the logarithmic trend-line

**10-Year Trend Progress** = Based on magnitude of the baseline trend (see page 3 for cut-off values)
Health Disparity Trend Graphs

The complete set of health disparity trend graphs is available at uwphi.pophealth.wisc.edu/programs/match/healthiest-state/progress-report/2013/disparity.htm. Examples based on infant death rates are provided below.

Although Wisconsin’s infant death rate is improving, disparities by subgroup are apparent when the trend and current values are broken out by gender, race/ethnicity, geography, and socioeconomic level. The 10-year trend for infant deaths is worsening among males, those with mothers who have a college degree and suburban counties. Wisconsin has work to do in order to bring the infant death rate down to the level of the healthiest subgroup. For instance, although the African American infant death rate is improving, the trend line is between two and three times as high as the other racial and ethnic groups indicating cause for concern and room for focused interventions to reduce disparity.
Health Outcome Trends

**Premature Death**
Baseline Trend = -1.3%/year  Much Better
Current Rate (vs. expected) = +3.6%  Worse

**Low Birthweight**
Baseline Trend = +0.9%/year  Worse
Current Rate (vs. expected) = -2.8%  Better

**Self-Reported Health**
Baseline Trend = +1.1%/year  Much Worse
Current Rate (vs. expected) = +13.6%  Worse

**All Ages Death**
Baseline Trend = -1.4%/year  Much Better
Current Rate (vs. expected) = +4.2%  Worse
Health Outcome Trends continued

**Infant Death**
Baseline Trend = -0.8%/year  Better
Current Rate (vs. expected) = -9.4%  Better

**1-24 Year Old Death**
Baseline Trend = -2.8%/year  Much Better
Current Rate (vs. expected) = +2.1%  No Difference

**25-64 Year Old Death**
Baseline Trend = -1.0%/year  Better
Current Rate (vs. expected) = +4.6%  Worse

**65+ Year Old Death**
Baseline Trend = -1.4%/year  Much Better
Current Rate (vs. expected) = +4.0%  Worse
Health Behavior Trends

**Smoking**
Baseline Trend = -2.5%/year  **Much Better**
Current Rate (vs. expected) = +0.8%  **No Difference**

**Obesity**
Baseline Trend = +3.2%/year  **Much Worse**
Current Rate (vs. expected) = -6.6%  **Better**

**Excessive Drinking**
Baseline Trend = -1.0%/year  **Much Better**
Current Rate (vs. expected) = -10.1%  **Better**

**Teen Birth Rate**
Baseline Trend = -1.5%/year  **Much Better**
Current Rate (vs. expected) = -9.4%  **Better**
Clinical Care Trends

No Health Insurance (0-17)
Baseline Trend = -5.9%/year  Much Better
Current Rate (vs. expected) = +12.2%  Worse

No Health Insurance (18-64)
Baseline Trend = +0.0%/year  No Change
Current Rate (vs. expected) = +8.3%  Worse
Social and Economic Trends

High School Drop-out
Baseline Trend = +2.0%/year  Much Worse  
Current Rate (vs. expected) = -8.3%  Better

Unemployment
Baseline Trend = +5.5%/year  Much Worse  
Current Rate (vs. expected) = -12.8%  Better

Children in Poverty
Baseline Trend = +5.1%/year  Much Worse  
Current Rate (vs. expected) = +1.6%  No Difference

Violent Crime Rate
Baseline Trend = +3.0%/year  Much Worse  
Current Rate (vs. expected) = -12.6%  Better
Physical Environment Trends

Air Pollution

Baseline Trend = +0.2%/year   No Change
Current Rate (vs. expected) = -9.0%   Better
