Executive Summary

The 2015 Wisconsin Health Trends: Progress Report

Background

The Wisconsin State Health Plan for 2020 established a goal for all state residents to live longer and better. Progress toward this goal can be measured by monitoring health outcomes – and the factors that contribute to those outcomes – for the state’s overall population, as well as by considering the health status of specific populations within the state. This fourth annual report assesses progress for 19 indicators of health outcomes and factors in Wisconsin by examining trends over the past 10 years and determining whether current rates are better or worse than expected.

Approach

Ten-year baseline trends for 19 leading health indicators were measured and compared to an improvement of one percent per year, the standard developed for the federal Healthy People 2020. To assess recent progress, the most current rate for each indicator was compared to the expected rate had the baseline trend continued. In addition, where data are available, we have analyzed 10 year trends on these leading health indicators broken out by gender, race and ethnicity, geography, and socioeconomic status. These detailed analyses are available online.

Results

When considering the overall population of the state, the 2015 report shows that the baseline mortality trends for all age groups in Wisconsin continue to improve, with the exception of the group of 25-64 year olds, for whom the mortality rate has remained stable. The greatest improvement in mortality is among children and young adults (ages 1-24). One health outcome, self-reported health, remains a cause for concern with an increasing percentage of adults reporting their health as fair or poor.

Within health behaviors, the rates of smoking, teen births, and excessive drinking continue to show improvement with decreasing trends while obesity rates continue to rise.

Although the most recent values for all socioeconomic factors were better than expected, the overall trends continue to worsen for all of these factors, including high school drop-outs, unemployment, children in poverty, and violent crime rate.

However, these patterns of improving health do not hold true for all of the subgroups that make up the state’s population, e.g.:

- The percentage of children in poverty is much higher for those living in urban counties compared with those living in rural, non-urban, and suburban counties.
- African American infants are almost twice as likely to be born at a low birthweight compared with infants of other racial/ethnic subgroups.
- Smoking rates are more than four times higher for those without a high school degree compared with those with a college degree.
- Male death rates are higher than female death rates across all age groups.

Readers can find disparity graphs by gender, race/ethnicity, geography, or socioeconomic status on our website: https://uwphi.pophealth.wisc.edu/programs/match/healthiest-state/progress-report/2015/disparity.htm.

Summary

Wisconsin continues to make progress toward the 2020 goal of residents living longer. However, not everyone in the state is living healthier. Many trends within the state, including increasing rates of people reporting their overall health to be fair or poor, adult obesity, and worsening social and economic factors, will lead to poorer health outcomes and more disparities if left unaddressed. Moreover, current trends in health outcomes and health factors are markedly different for various subgroups within the state’s population. Efforts to improve health in Wisconsin must consider the full array of factors that influence how long and how well we live and reevaluate the circumstances that may produce longer and healthier lives for some – but not all – of the state’s residents.
Overview of The 2015 Wisconsin Health Trends: Progress Report

The 2015 Wisconsin Health Trends: Progress Report provides a way to assess whether Wisconsin is achieving the twin goals of the Wisconsin State Health Plan: Healthiest Wisconsin 2020: Improve health across the life span, and eliminate health disparities and achieve health equity.

How we measure health
The 19 health indicators examined in this report are based on a model of population health (from the County Health Rankings) that emphasizes that many factors, which if improved, can contribute to longer, healthier lives for all. We analyzed data for eight measures of health outcomes and 11 measures reflecting key health behavior, clinical care, socioeconomic, and environmental factors that impact health outcomes.

How progress is assessed
We calculated the annual percent change (APC) for each of the 19 health indicators over 10 years. For each indicator, an increasing APC indicates a worsening baseline health trend, while a decreasing APC indicates an improving trend.

- A ▲ or ▼ indicates Wisconsin improved on the health indicator during the past 10 years;
- A ▷ indicates Wisconsin’s performance on the health indicator has been stable; and
- A ▼ or ▲ indicates Wisconsin’s performance worsened during the past 10 years.

Using these baseline trends, we determine what the “expected” current rate (for the most recent year available) would be for each indicator if the past baseline 10-year trend continued. We compare this expected rate with the current “observed” rate to assess whether it is better or worse than predicted. Current progress is determined by comparing the expected rate to the observed rate.

- A ● indicates Wisconsin is performing better than expected for the health indicator;
- A ○ indicates Wisconsin is performing approximately the same as expected;
- A △ indicates Wisconsin is performing worse than expected for the health indicator.

The 2015 Wisconsin Health Trends: Progress Report is intended for use by public health professionals, policy makers, those engaged in local health improvement initiatives, and concerned citizens who are interested in assessing long-term and recent trends in leading health indicators. Readers may wish to use the Progress Report findings to begin or expand efforts to improve Wisconsin’s performance on one or more of these leading health indicators. To identify evidence-based strategies that promote health improvement, visit whatworksforhealth.wisc.edu.

To find resources to develop an action plan that works for your community, please visit www.countyhealthrankings.org.

In addition to The 2015 Wisconsin Health Trends: Progress Report, information on health trends among specific subgroups is now available online. Where data are available, graphs show trend data for the 19 leading health indicators included in this report, which are further broken down by gender, race/ethnicity, geography, and socioeconomic status. These graphs reveal how disparities in health factors and health outcomes within the state have improved or worsened in the last ten years. An example of the disparity graphs can be found on page 6. All others can be accessed at http://uwphi.pophealth.wisc.edu/programs/match/healthiest-state/progress-report/2015/disparity.htm.
## Health Outcomes

### Current Rate (versus expected)

## Baseline Trend Progress

- **APC** = Annual Percent Change

- **APC** = **+1.0%/year**
- **APC** = **+0.5%/year**
- **APC** = **-0.5%/year**
- **APC** = **-1.0%/year**

- **Current Progress**

  - = **Current Rate is worse than expected rate (p<0.10)**
  - = **Current rate is the same as expected rate**
  - = **Current rate is better than expected rate (p<0.10)**

  **baseline trend progress** = 

  - = **APC** > +1.0%/year
  - = **+1.0%/year** ≥ **APC** > +0.5%/year
  - = **+0.5%/year** ≥ **APC** ≥ -0.5%/year
  - = -0.5%/year > **APC** ≥ -1.0%/year
  - = -1.0%/year > **APC**
How to Interpret the Report

The 2015 Wisconsin Health Trends: Progress Report is useful for examining long-term trends and assessing how current rates of specific health indicators compare to those trends. Below is a guide to understanding the numbers and graphs provided in this report.

1. The known data points for the 10 years prior to the current year are plotted and a best fit linear regression is added to the graph and colored according to the measure’s APC baseline trend progress. A decreasing line (▼) indicates improvement: this example shows a reduction in infant deaths.

2. The line is extended in grey in order to show the expected value if Wisconsin continued with the same trend as that of the previous 10 years (\(\bar{y}\)).

3. The current observed value (○) is shown and colored according to current progress, along with its 90% statistical confidence interval (where possible). Comparing this point to the expected trend line provides a comparison of how well Wisconsin is currently doing compared to expectations.

4. The percent difference is calculated as:
   \[
   \text{Percent Difference} = \frac{\text{observed value}-\text{expected value}}{\text{expected value}} \times 100
   \]

For the infant death rate example above, the baseline trend shows that infant mortality rates decreased 1.0% per year (i.e., an improving trend). This is good news for Wisconsin. The trend is improving. However, the current rate (using data from 2013, the most recent year for which data was available), is 4.1% more than expected (6.2 vs. 6.0). This difference – at a \(p=0.1\) level – is not significant, indicating that Wisconsin performed approximately as expected.

</tbody>
</table>
These sample graphs show that although Wisconsin’s infant death rate is decreasing overall, disparities by subgroup are apparent when the trend and current values are broken out by gender, race/ethnicity, geography, and socioeconomic level. The 10-year trend for infant deaths is improving for the subgroups where the trend line is decreasing (e.g., for college graduates). However, the 10-year trend for infant deaths is not improving for those who have graduated high school nor for those who have not graduated high school, as is shown by the yellow trend line. Wisconsin has significant work to do in order to bring infant death rates for all subgroups down to the level of the healthiest subgroup. For example, the trend line for high school graduates reflects rates that are nearly twice as high as the rates for college graduates.
Health Outcome Trends

All Ages Death
Baseline Trend = -0.8%/year  Better
Current Rate (vs. Expected) = +3.4%  Worse

Premature Death
Baseline Trend = -0.9%/year  Better
Current Rate (vs. Expected) = +5.9%  Worse

Infant Death
Baseline Trend = -1.0%/year  Better
Current Rate (vs. Expected) = +4.1%  No difference

1-24 Year Old Death
Baseline Trend = -2.8%/year  Much Better
Current Rate (vs. Expected) = +5.1%  No difference
Health Outcome Trends (continued)

25-64 Year Old Death
Baseline Trend = -0.3%/year  No Difference
Current Rate (vs. Expected) = +5.0%  Worse

65+ Year Old Death
Baseline Trend = -0.9%/year  Better
Current Rate (vs. Expected) = +2.9%  Worse

Low Birthweight
Baseline Trend = +0.5%/year  No Difference
Current Rate (vs. Expected) = -2.7  Better

Self-Reported Health¹
Baseline Trend = +2.0%/year  Much Worse
Health Behavior Trends

**Smoking**
Baseline Trend = -1.0%/year  Better

**Obesity**
Baseline Trend = +3.1%/year  Much Worse

**Excessive Drinking**
Baseline Trend = -1.3%/year  Much Better

**Teen Birth Rate**
Baseline Trend = -3.5%/year  Much Better
Current Rate (vs. Expected) = -15.2%  Better
Clinical Care Trends

No Health Insurance (0-17)$^2$
Baseline Trend = -1.4%/year  Much Better

No Health Insurance (18-64)$^2$
Baseline Trend = +1.9 %/year  Much Worse

Youth (0-17) without Health Insurance During Past Year (%)

Population (18-64) without Health Insurance During Past Year (%)
Social and Economic Trends

High School Drop-Outs
Baseline Trend = +0.9%/year   Worse 
Current Rate (vs. Expected) = -14.9%   Better

Unemployment Rate
Baseline Trend = +6.4%/year   Much Worse 
Current Rate (vs. Expected) = -34.4%   Better

Children in Poverty
Baseline Trend = +4.2%/year   Much Worse 
Current Rate (vs. Expected) = -4.1%   Better

Violent Crime Rate
Baseline Trend = +2.3%/year   Much Worse 
Current Rate (vs. Expected) = -0.9%   No difference
**Physical Environment Trends**

**Air Pollution**

Baseline Trend = -0.8%/year  Better

Current Rate (vs. Expected) = -8.7%  Better  ●

**Technical Notes**

1. Due to methodological changes to sampling methods of the Behavioral Risk Factor Surveillance System (BRFSS), data from 2013 – the ‘current observed value’ – and data from 2012 is not directly comparable to that of previous years. The BRFSS methodology changed in 2011 but the dataset maintained a ‘landline only’ weighted variable, allowing for a 2011 variable that is comparable to previous years. For more information, please read the BRFSS Methodological Documents: [http://www.cdc.gov/surveillancepractice/reports/brfss/brfss.html](http://www.cdc.gov/surveillancepractice/reports/brfss/brfss.html). A diamond is used instead of a circle for the 2012 and 2013 values to convey this discrepancy.

2. Due to changes to the sampling methods of the Family Health Survey data occurring in 2012, the data from 2014 – the ‘current observed value’ – and data from 2012 is not directly comparable to that of previous years. For more information, read the Family Health Survey Technical notes for 2012: [http://www.dhs.wisconsin.gov/publications/P4/p45369b-12.pdf](http://www.dhs.wisconsin.gov/publications/P4/p45369b-12.pdf). A diamond is used instead of a circle for the 2012 and 2014 values to convey this discrepancy.

3. Due to a lack of comparability, the High School Drop-out data does not include the 2003-2004 school year.

4. Linear trends are used in this report in order to have a standard method for assessing progress across different measures. However, the limitations of using 10-year linear trends are evident in several measures. Using trend lines may have several issues, namely, 1) trends within trends (e.g., caused by a specific policy change) are not visible, 2) linearity may not be appropriate, and 3) the indicators use point estimates yet may have large confidence intervals, which means using a trend line may misrepresent the actual trend.
